

n8n Workflow Overview (AI-Powered JSON Comparison)

Platform: n8n (Low-code Workflow Automation)

Key Characteristics

- Plug-and-play workflow automation platform
- Supports API integrations, databases, AI models, and custom code
- Can securely store and reuse API tokens/credentials during workflow execution

- Supports orchestration similar to an **ICEPOT-style framework** (Input → Context → Execution → Processing → Output → Tracking)

Output Generation

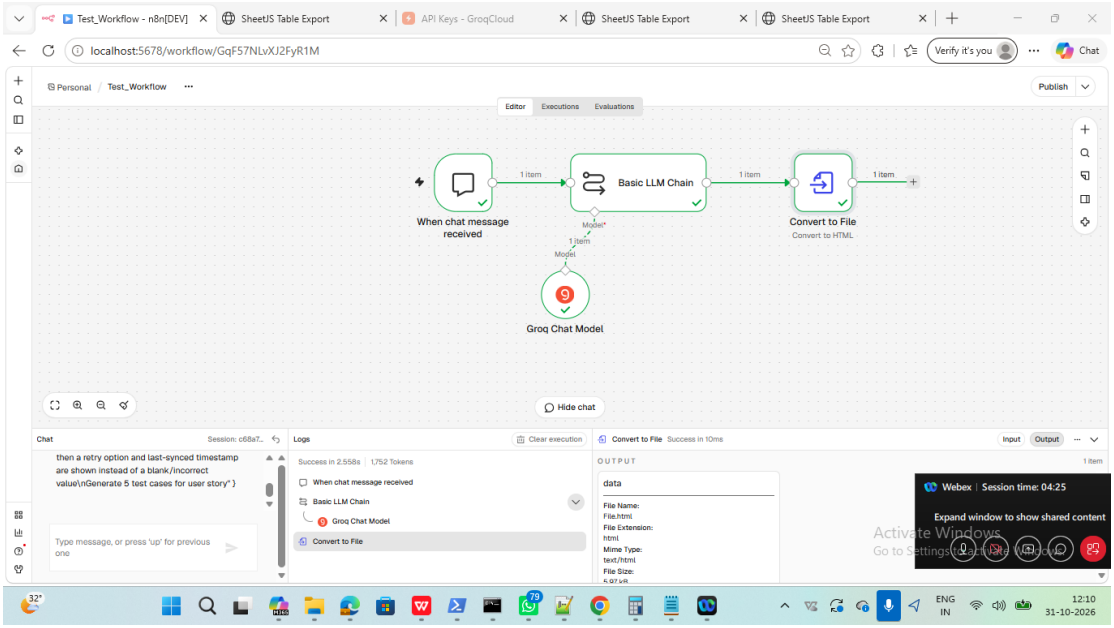

Each every time input need to given in chat

Chat : Check Account Balance

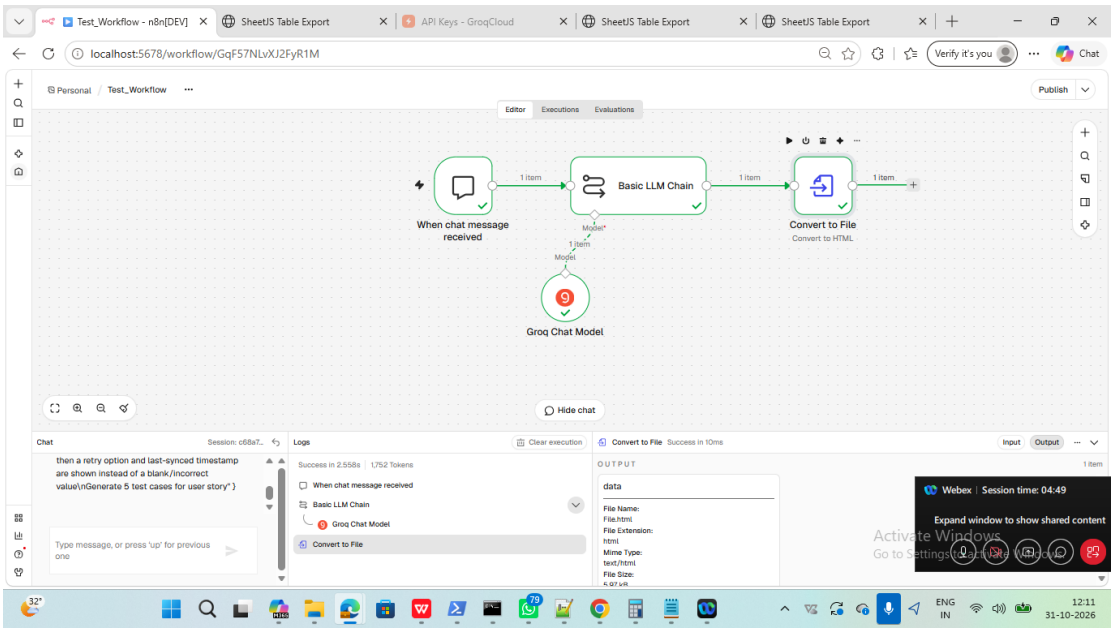

As a bank customer
I want to view my real-time account balance
So that I know my available funds before making decisions

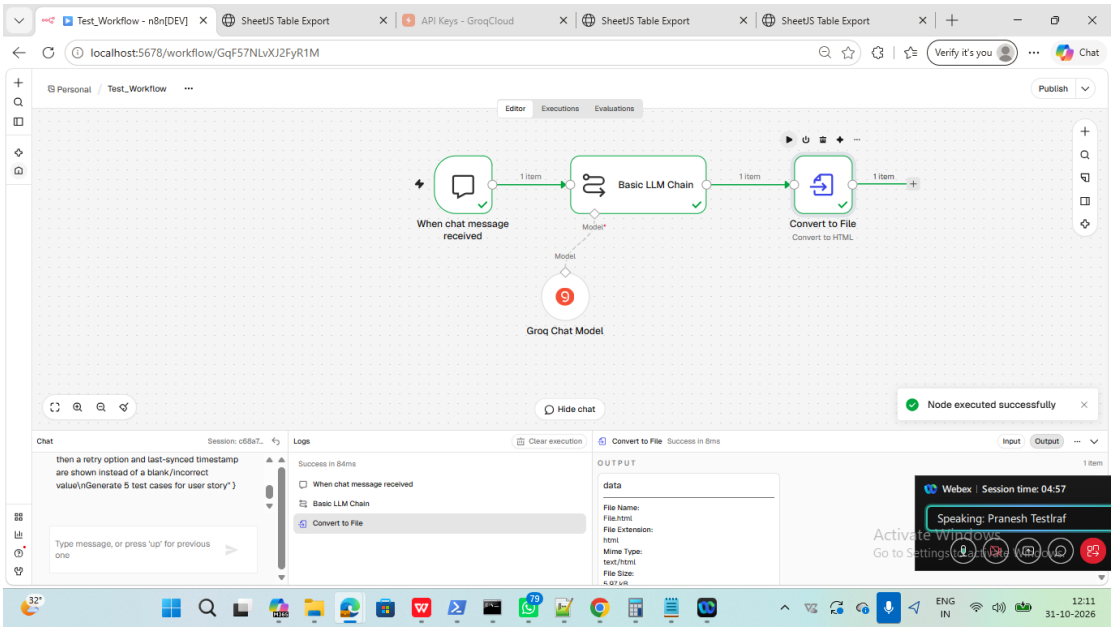

Acceptance Criteria:
- Given I'm logged in, when I open the "Accounts" tab, then my current balance and available balance (post-holds) are displayed
- Given I have multiple accounts, when I view the dashboard, then balances for all linked accounts are shown separately
- Given the balance fails to load, when there's a network/service error, then a retry option and last-synced timestamp are shown instead of a blank/incorrect value

"text": "Test Case ID: TC_AB_001\nTitle: Verify current and available balance display for a single logged-in account\nPreconditions: User is logged in; user has at least one active account with known current and hold amounts\nSteps:\n1. Navigate to the \"Accounts\" tab.\n2. Observe the displayed \"Current Balance\" and \"Available Balance\" for the account.\nExpected Result: The screen shows the correct current balance and the available balance (current balance minus holds) matching the backend data.\n\nTest Case ID: TC_AB_002\nTitle: Verify balances for multiple linked accounts are shown separately on the dashboard\nPreconditions: User is logged in; user has two or more linked accounts with distinct balances\nSteps:\n1. Open the application dashboard.\n2. Locate the \"Accounts\" section.\n3. Review the balance information displayed for each linked account.\nExpected Result: Each account is listed with its own current and available balance, correctly reflecting the data for each account.\n\nTest Case ID: TC_AB_003\nTitle: Verify error handling when balance service fails (network/service error)\nPreconditions: User is logged in; simulated network/service failure for balance API\nSteps:\n1. Navigate to the \"Accounts\" tab.\n2. Observe the UI response when the balance request fails.\n3. Click the \"Retry\" button presented.\n4. Restore network connectivity.\n5. Click \"Retry\" again.\nExpected Result: Initially, a retry option and a \"Last synced: <timestamp>\" message are displayed instead of a blank/incorrect value; after retry, the correct balances load and the timestamp updates.\n\nTest Case ID: TC_AB_004\nTitle: Verify display of maximum possible balance (boundary condition) and formatting\nPreconditions: User is logged in; user has an account with a very large balance (e.g., 9,999,999,999.99)\nSteps:\n1. Navigate to the \"Accounts\" tab.\n2. Observe the balance values shown for the account.\nExpected Result: The large balance is displayed without truncation or overflow, using proper thousand separators and two decimal places, and the available balance reflects any holds correctly.\n\nTest Case ID: TC_AB_005\nTitle: Verify balance refresh after logout/login to prevent stale data\nPreconditions: User is logged in; account balance is known; user logs out while on the \"Accounts\" page\nSteps:\n1. Log out of the application.\n2. Log back in with the same credentials.\n3. Navigate to the \"Accounts\" tab.\n4. Compare the displayed balances with the expected current
